GO_MF | B
structural molecule activity
active transmembrane transporter activity
oxidoreductase activity, acting on paired donors, with incorporation or reduction of molecular oxygen
sulfur compound binding
structural constituent of ribosome
iron ion binding
primary active transmembrane transporter activity
proton transmembrane transporter activity
modified amino acid binding
transferase activity, transferring alkyl or aryl (other than methyl) groups
electron transfer activity
glutathione transferase activity
zinc ion transmembrane transporter activity
oxidoreduction−driven active transmembrane transporter activity
oligopeptide binding
glutathione binding
eductase activity, acting on paired donors, with oxidation of a pair of donors resulting in the reduction of molecular oxygen to two molecules of water
NADH dehydrogenase (ubiquinone) activity
